

Me and Malte overtook the responsibility to make the numbers get a different color when the value exceeded a certain number. I also did some "touching up" and fixed a few small bugs. This was a result of another coding team asking for help. I also Put together a checklist for how the team should comment on their code and reminded everyone to follow this checklist. This is something that could help everyone in the team since it gives a better understanding to anyone who might need to understand someone else's text.

From this point, I will not repeat that I can help my team by providing relevant feedback during the sprint reviews, and assisting when someone asks for help during the week. I will also not repeat that I have contributed to my team's use of scrum by participating and being active in the meetings where we, for instance, write do a sprint review, act as PO's, write a team reflection, and create user stories. I also check that everyone has commented on their code. Lastly, I will not repeat that I want to get better at coding in our coding environment and at being of assistance to my team. The reason I will not repeat these points is that they are the same every week.
